

PROJECT NAME

Launch a Drupal instance with Amazon Lightsail

PREPARED BY,
HARI PRAKASH R

Lightsail:

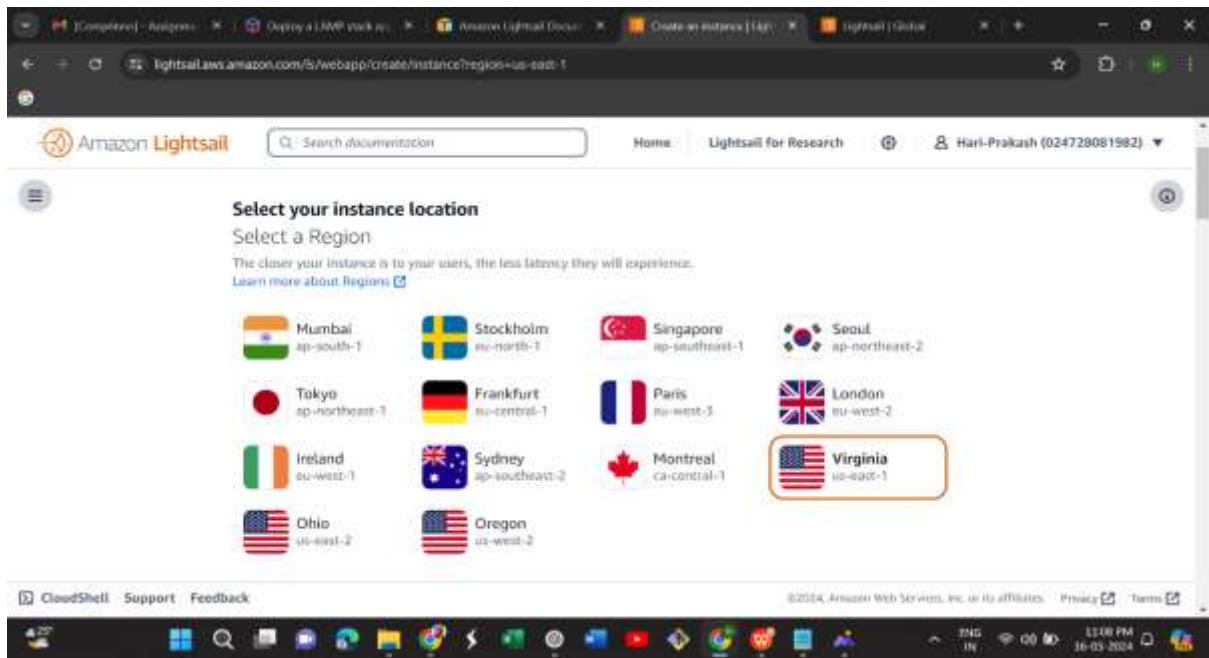

Amazon Lightsail is a AWS service easy-to-use virtual private server (VPS) instances, containers, storage, databases,more at a cost-effective monthly price.

The main benefit is it's simplified setup and management processes allow businesses to quickly deploy and maintain their applications.

Drupal :

Drupal is a popular and customizable content management framework

Drupal is a free, Open Source content management system to build and maintain websites, online directories, e-commerce stores and other types of digital content

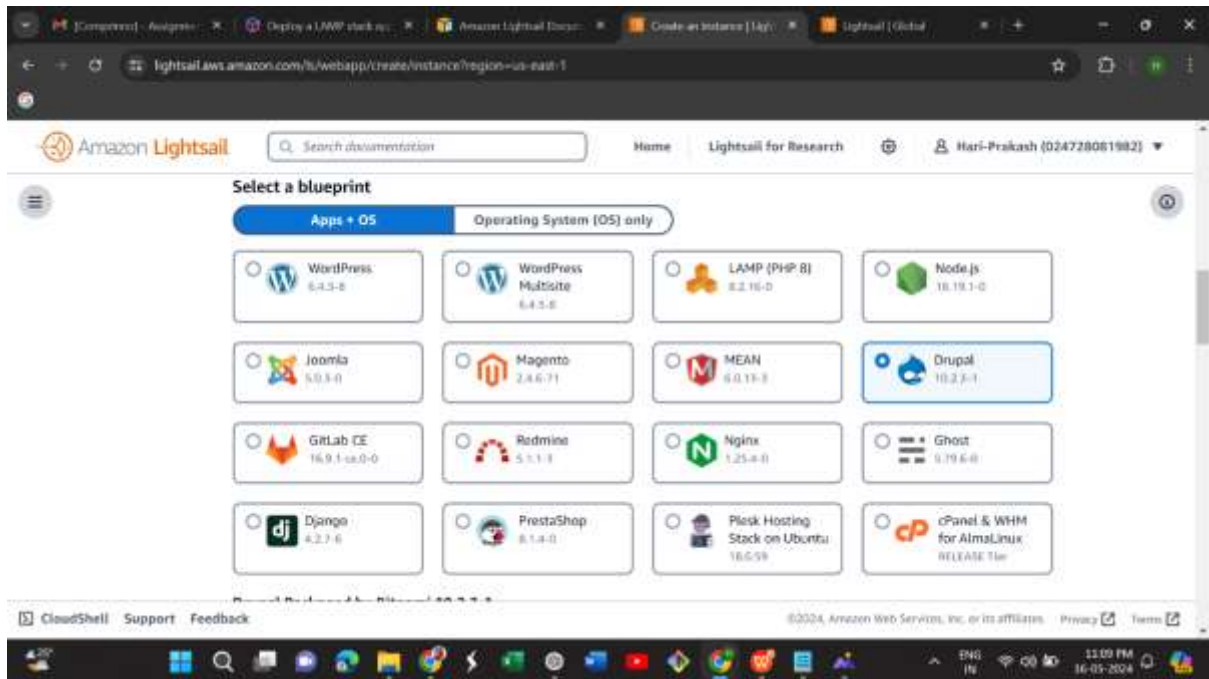

Step1:

In the AWS Management console, go to Lightsail.

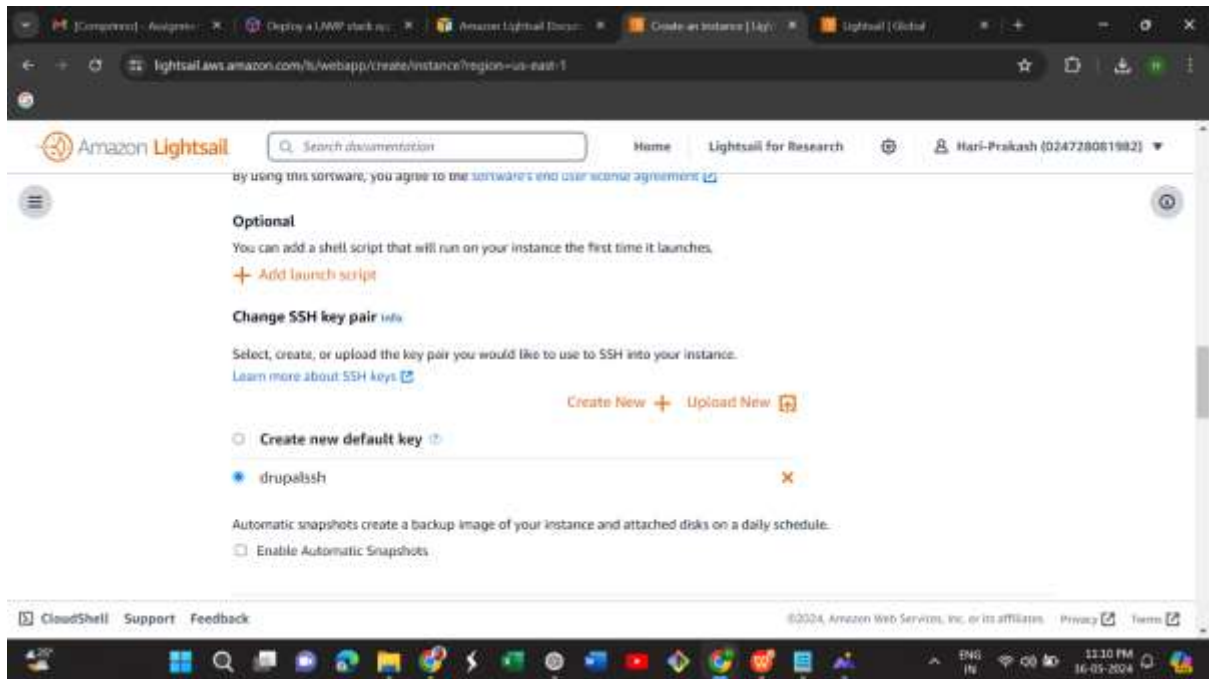

Then Create an Instance

Then select the required AWS region and Availability zone

Step2:

- Select the Image as Linux (Platform)
- Select the blueprint (APP + OS) as Drupal

Step 3:

- Change the SSH key pair ☑ create new key pair
- Then select the required instance cost plan

Select a network type [Info](#)

The selected blueprint isn't compatible with an IPv6-only instance plan. [Learn more](#)

Dual-stack **Recommended**

For workloads that require full network compatibility. Includes a public IPv4 and a public IPv6 address.

IPv6-only

For workloads that do not require a public IPv4 address. Includes a public IPv6 address.

Step 4:

- Provide a name to the instance
- Provide key- tag values
- Key as server and tag as Drupal
- Then create the instance

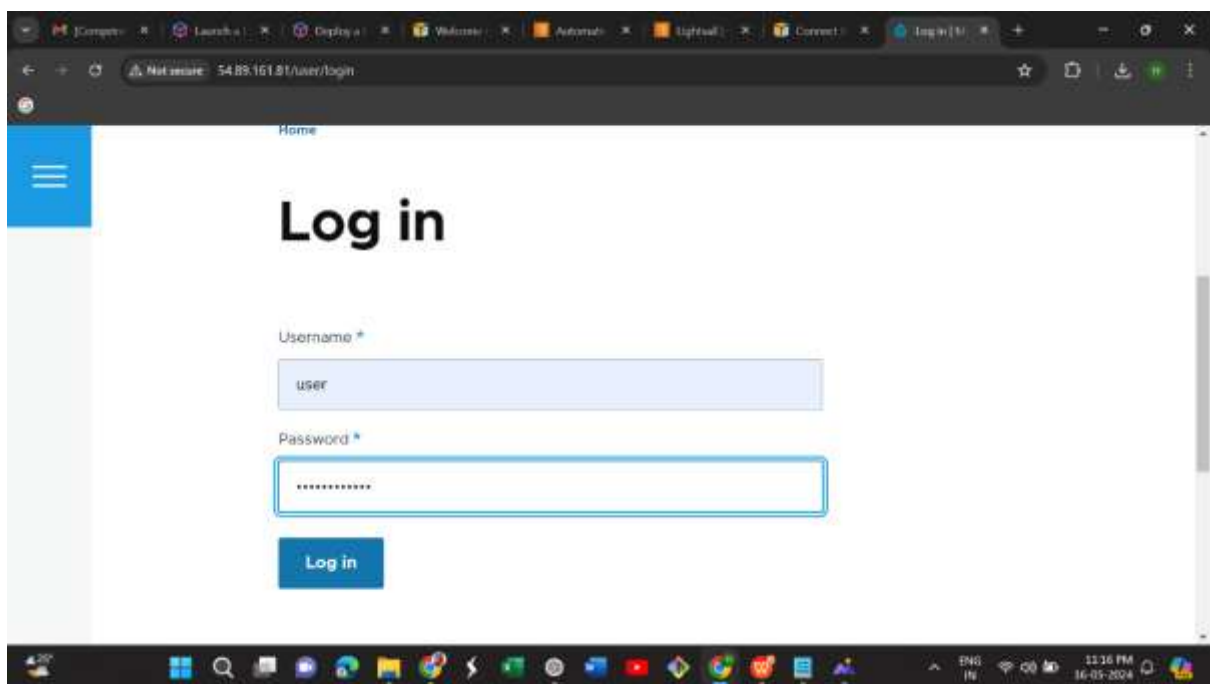

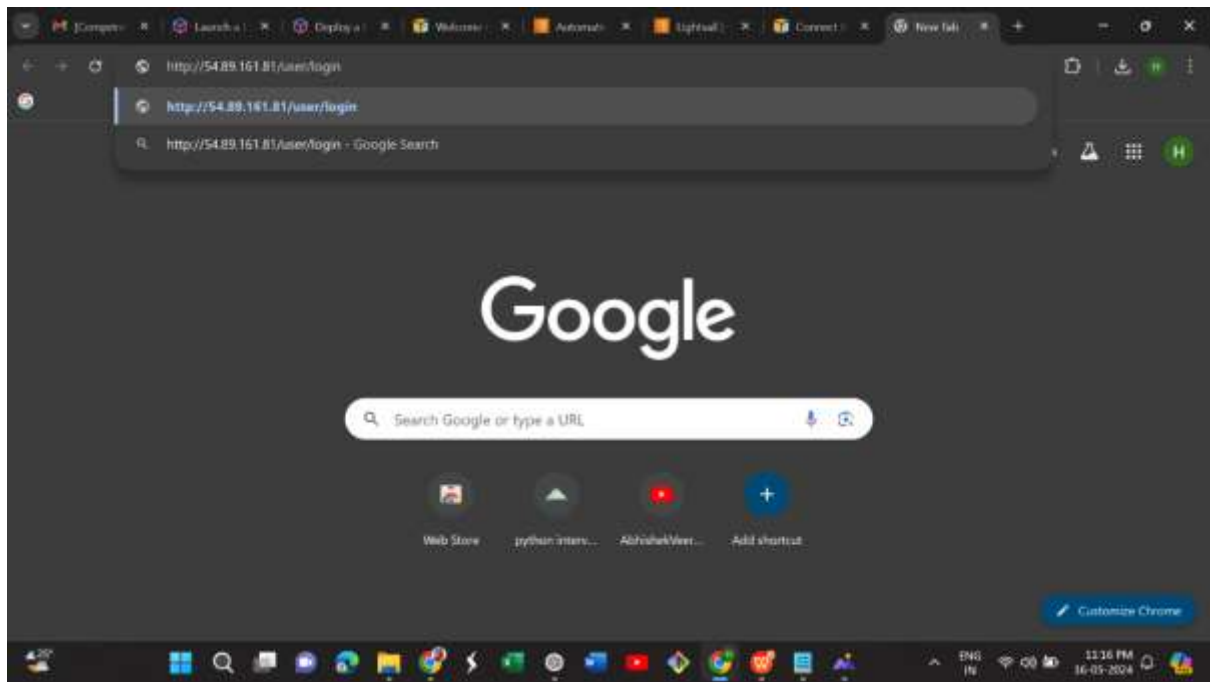

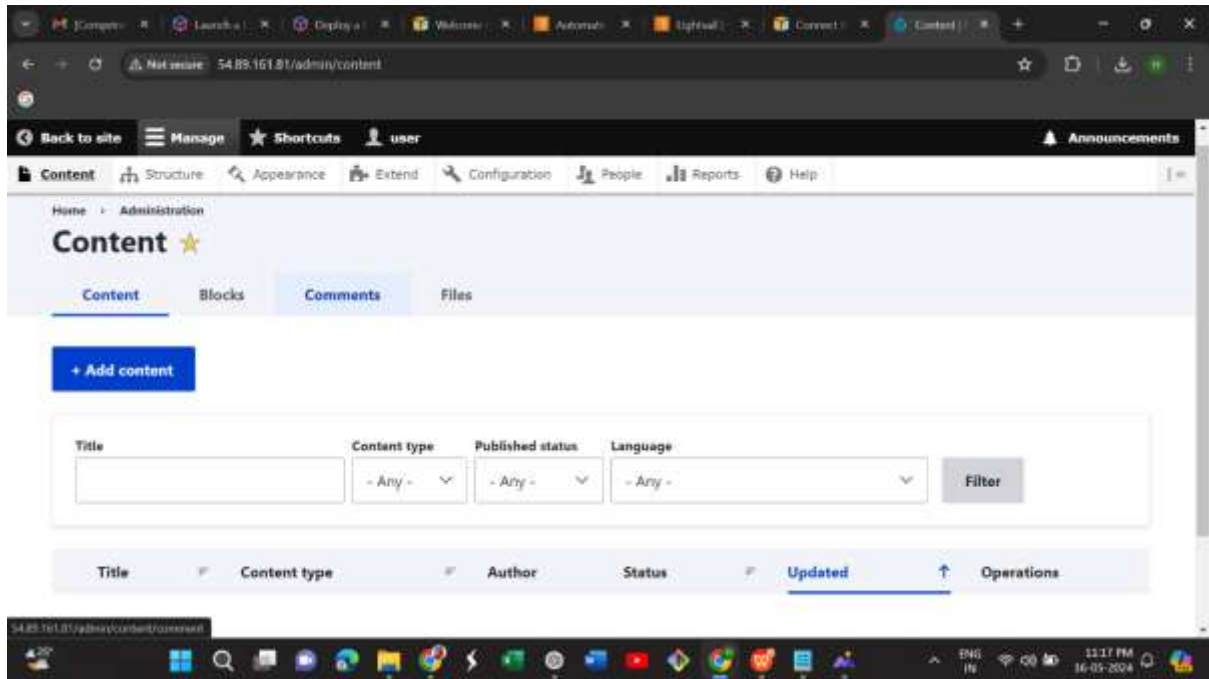

- **Step 5:**
- Using the terminal, connect the instance using SSH
- Make sure the server is running

Step 6:

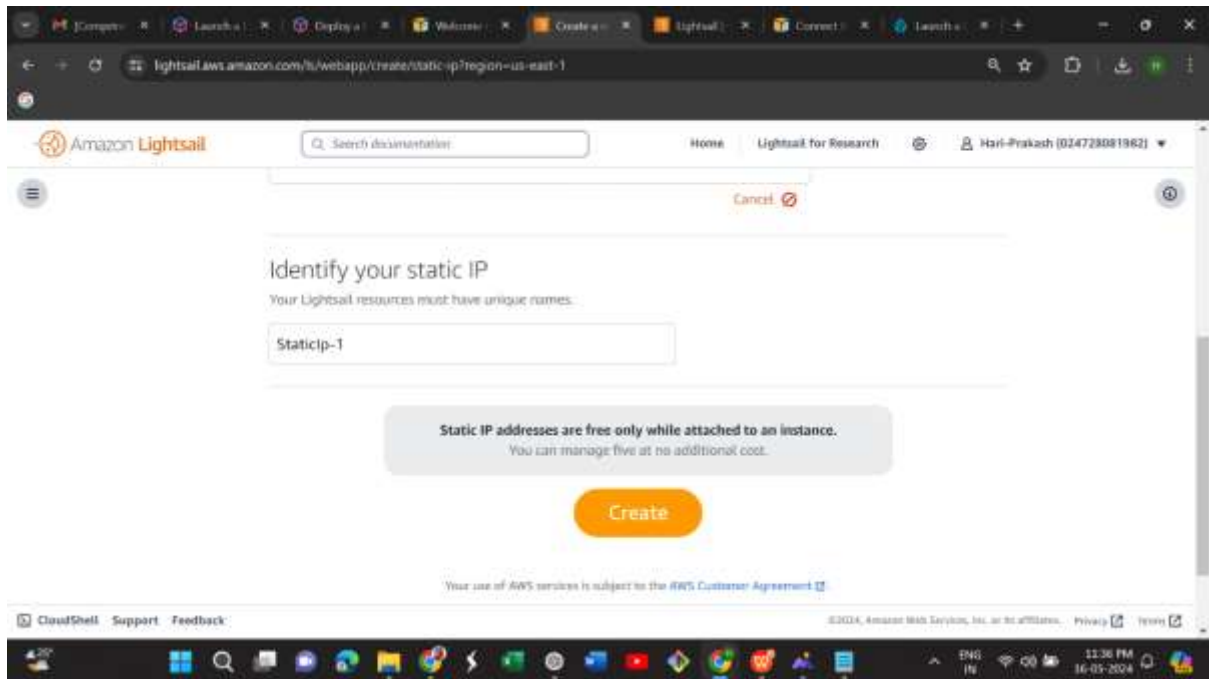

- Copy and paste the public IP of the instance in
- new tab of the browser and make sure the
- Application is running

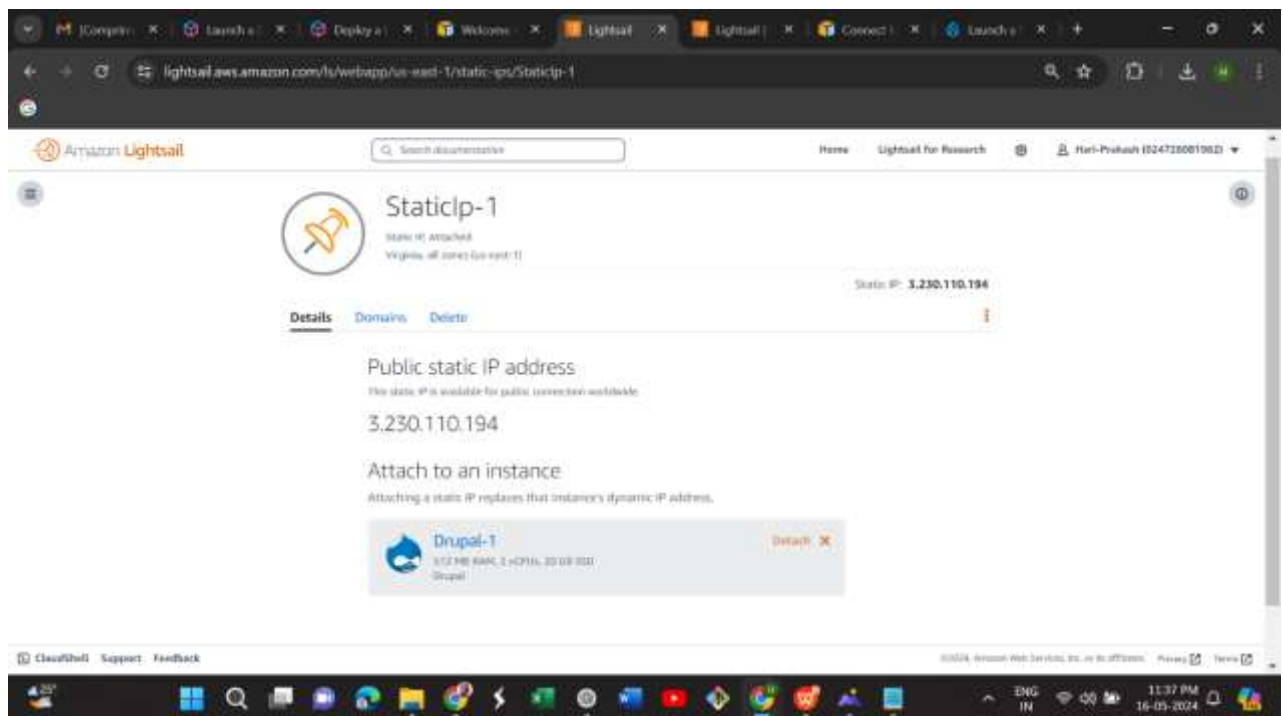

Step 7:

- Give the user name and password and login into the application
- Goto the Content tab -> Add content and save it

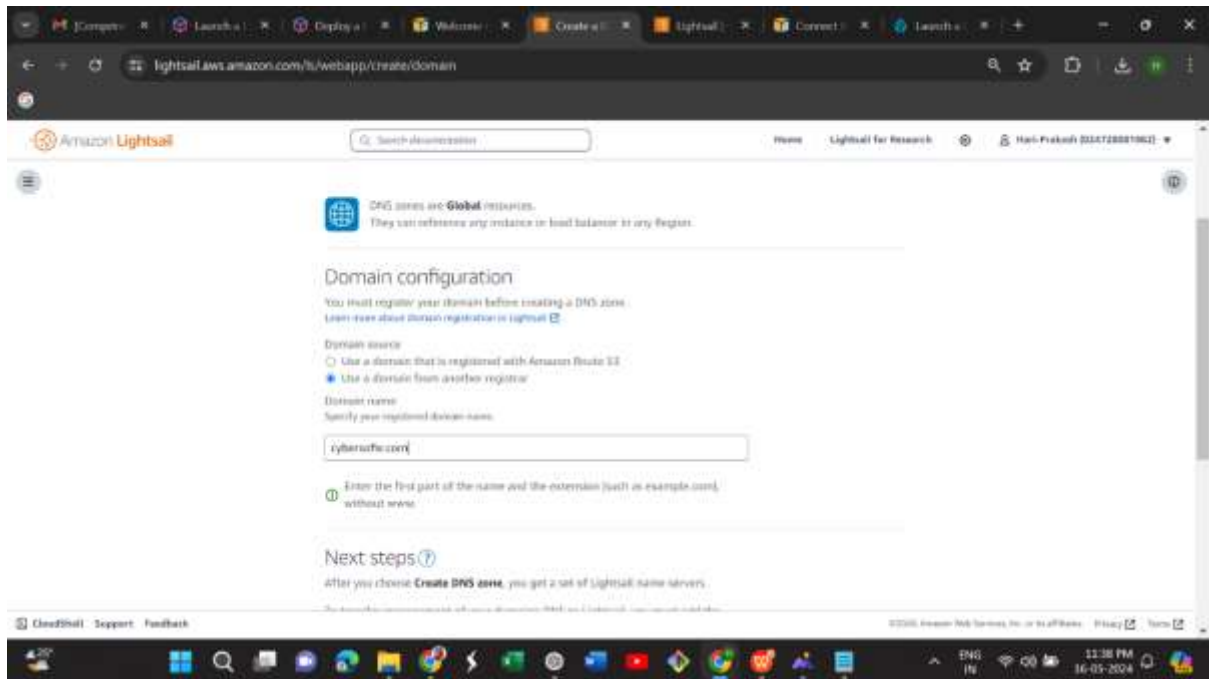

Step 8:

- The default public IP for your Drupal instance changes if you stop and start your instance.
- A static IP address, attached to an instance, stays the same even if you stop and start your instance.

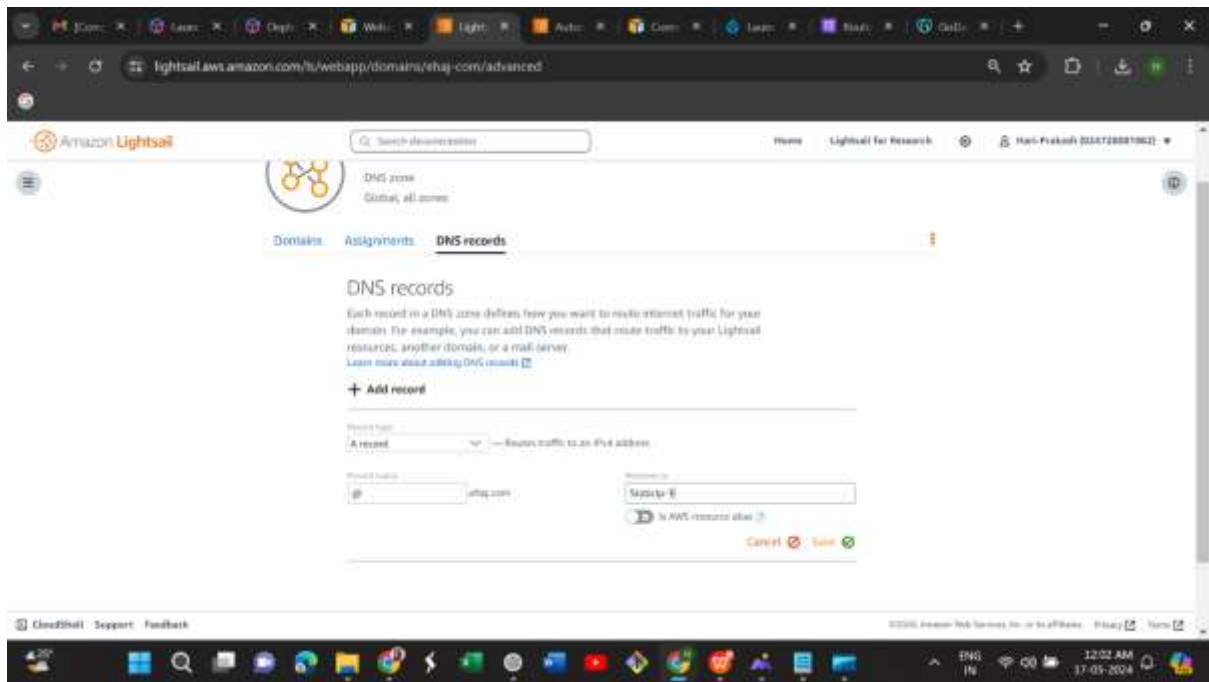

Now the static IP address is created successfully

Step 9:

- Go to Lightsail -> Instance -> Domains&DNS
- In Domain zone , give a name to Domain and create a domain zone

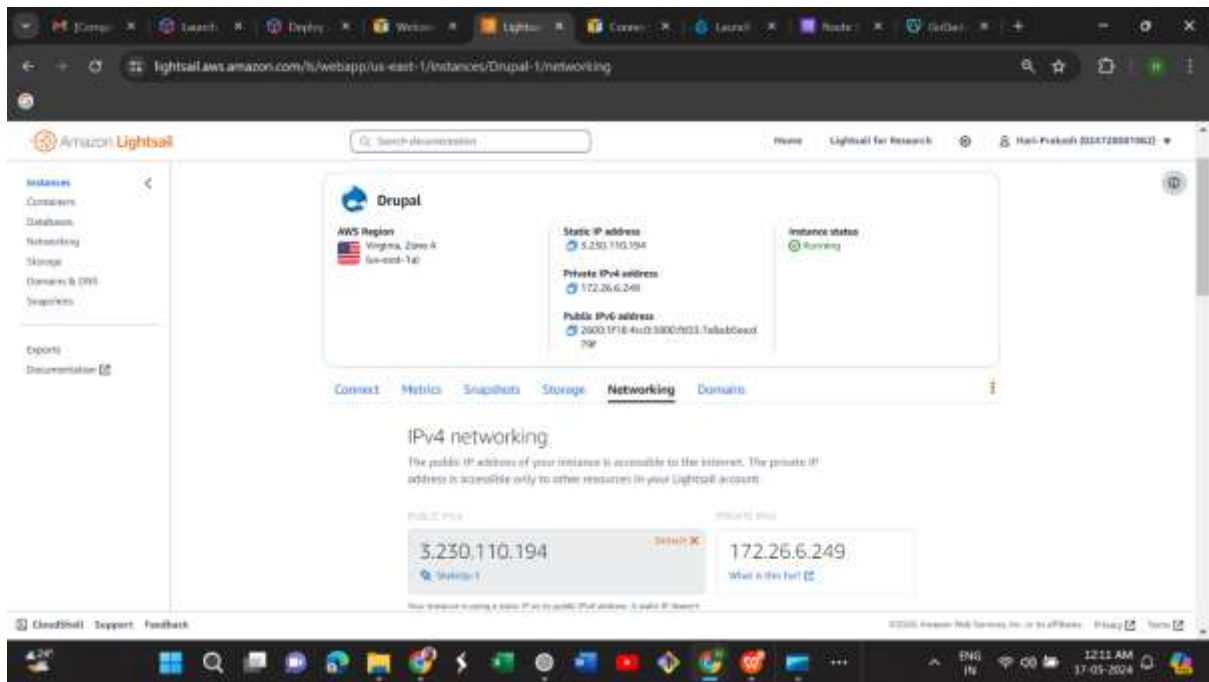

Step 10:

- After creating a domain zone, move to DNS records
- In DNS record, add a record
- Record type - A record
- Record name - @
- Resolves to – StaticIp-1

Step 11:

Now save the record which is created in DNS record

- Allow time for the change to propagate through the internet's DNS before domain begins routing traffic to your Drupal instance
- Now ,we have used Amazon Lightsail to launch and deploy a Drupal instance.
